- Electric Arc Furnace (EAF)

- Post-consumer material is defined as waste material generated by households or by commercial, industrial and institutional facilities in their role as end-users of the product, which can no longer be used for its intended purpose.

- Pre-consumer material consists of fragments of finished products of a manufacturing process.

- Home Scrap is internally generated scrap from steel processing operations and which does not fall into either of the pre-consumer or post-consumer scrap categories.

- ATAS certifies that as per LEED 2009 Building Design and Construction Reference Guide section for Materials and Resources calculator for applicable recycled content credits that our steel material qualifies as a contributor for MR credit 4 as referenced by the calculator utilized by LEED.

**Equation 1**

Recycled Content Value ($) =

\[ (\% \text{ post-consumer recycled content} \times \text{material cost}) + 0.5 \times (\% \text{ pre-consumer recycled content} \times \text{material cost}) \]

**Equation 2**

Percent Recycled Content = Total Recycled Content Value ($) ÷ Total Materials Cost ($)

*ATAS sources materials based on availability and price. The recycled content shown is an example of one supplier’s material as sourced by ATAS. When a certain recycled content is required by the customer, the material can be sourced, however extended lead times and increased costs may be incurred. ATAS is certified to ISO 9001: 2015 with design and development and has complete traceability on all materials used in the production of primary products.
